

WOTAN® S3I

INTERNAL CYLINDRICAL GRINDING MACHINE

with compact design, flexible and precise like the >big ones<, for light and small components.

The small machine with lots of options...

Internal cylindrical grinding machines of the WOTAN® S31 series are designed for processing small and mediumsized workpieces. The workpiece spindle can hold loads of up to 400 kg. Our flexible machine design enables us to optimize each machine for your specific grinding jobs.

> The **WOTAN® S3I** is suitable for high-precision cylindrical grinding to process internal diameters of chuck parts with a swing diameter of up to 360mm and a workpiece length of 400mm that are clamped on one side only ("flying") without additional support – especially suitable for grinding internal front surfaces as well as internal diameters.

...for internal cylindrical grinding and much more.

WORKPIECE SPINDLE

On the workpiece side, the WOTAN® S3I is equipped with a manual angle adjustment (with angle measuring system) for cylinder correction. Optionally, the machine can be equipped with a steplessly swiveling round table (B1 axis) for turning the workpiece spindle. This allows optimum implementation of taper grinding.

LARGE SELECTION OF SPINDLES

Depending on the accuracy requirements, the workpiece spindle can be designed as belt-driven or directly driven spindle or as spindle with a hydrostatic bearing. If the workpiece spindle is equipped with a measuring system (C axis), you can perform high-precision non-round grinding operations in various applications on a cylindrical grinding machine.

The machine is equipped with a Z axis and an X axis (cross table) on the side of the grinding spindle. The grinding unit is mounted on the cross table (X axis rectangular on the Z axis). This configuration will allow the economical and efficient processing of internal diameters and front surfaces in one clamping.

More flexibility through intuitive WOP[™] interface

FLEXIBILITY THROUGH SPINDLE TURRETS

The optional equipment of the machine with a grinding spindle turret (B2 axis) with up to 4 grinding spindles can considerably increase both its flexibility and diversity – without exchanging the spindles. It is either beltdriven grinding spindles or high-frequency grinding spindles that are used for this purpose. Belt-driven spindles can be manually exchanged which increases the variability even more.

EXAMPLE OF THE CONFIGURATION FOR THE B2 AXIS

EXTERNAL AND PLANE GRINDING IS ALSO POSSIBLE

The machine will also allow the additional external cylindrical and plane surface grinding of short seats. In order to do so, a belt-driven grinding spindle equipped with an external and plane grinding wheel ("vector disk") that is profiled on both sides will be positioned on the grinding spindle turret (B2 axis). A wide range of internal diameters can then be processed with further grinding spindles that are positioned on the grinding spindle turret.

VECTOR DISKS

Allows the grinding of internal front surfaces and internal diameters as well as the grinding of external front faces + external diameters

belt-driven spindle +
 high-frequency spindles

...parameterize instead of programming

VARIOUS DRESSERS CAN BE SELECTED

The dressing unit can be equipped with stationary and driven dressing tools, which will allow working not only with conventional corundum grinding wheels but also with Cubic Boron Nitride (CBN) grinding wheels.

NUMEROUS OPTIONS AVAILABLE

Depending on the grinding job to be performed, we also integrate a spark-in control & incision detection via a fluid sensor system, more measuring equipment, re-tooling systems and much more.

MODERN CONTROL AND EASY USER INTERFACE

The drive package is based on a SINUMERIK 840 D control – SOLUTION LINE – from SIEMENS with the latest generation of servo motors.

All machines are equipped with our own, user-friendly operator interface with workshop oriented programming (WoP),that allows an uncomplicated, menu-guided operation of the machine and its programming without CNC knowledge. All operations necessary for the process allow the continuous handling of the machine, regardless of its operating status. The standard interface of SIEMENS is also available at the same time.

INTERNAL GRINDING

WOTAN®-U

UNIVERSAL GRINDING

WOTAN® -A EXTERNAL GRINDING

special solutions CUSTOMIZED PRODUCTS

Our experts will accompany you on the way from the first inquiry to the after-sales service thus ensuring the daily operations of your machine, so that you will get an optimal grinding machine from us.

- $\mathcal{Q}_{\mathbf{k}}$ exact agreement of the requirements
- individual offer for a grinding machine
- 🖉 individual design
- production
- Q quality assurance
- O- test grinding
- pre-acceptance of the machine
- delivery & installation
- training & familiarization
- හැ 🕄 🕄 🕄

We will be pleased to demonstrate the potential of all our WOTAN® machines at our headquarters in Glauchau, where we also accept grinding jobs for test purposes and on a contract basis.

STATUS: 9/12/2023 CURRENT INFO YOU WILL FIND ON OUR WEBSITE.
